CELERIS ROUTE

IDENTITY VERIFICATION SYSTEM RECORD

Record type: Driver identity verification workflow

Driver account: CR-DRV-48217

Account holder: Daniel Reyes

VERIFICATION WORKFLOW

Celeris Route uses an identity-verification step for certain driver account activity. When verification is required, the driver must first successfully authenticate to the driver account. The verification function then requests a facial image from the person completing the verification.

SYSTEM PROCESS

Step	System action
1	Driver account authentication is completed.
2	Identity-verification function becomes available.
3	A facial image is captured from the person completing verification.
4	The submitted image is compared with the identity image associated with the account.
5	The verification result is recorded in the account activity record.

ACCOUNT ACCESS REQUIREMENT

The facial-verification function is not available to an account session until the account has been successfully authenticated.

A successful authentication establishes that the account session passed the required account authentication step. The authentication record does not independently establish the identity of the individual who entered or possessed the account credentials.

VERIFICATION REVIEW

A facial-verification result that does not appear to match the identity image associated with the account may be reviewed together with account access, activity, and account-history information.

This system record describes the verification workflow and does not identify the person who operated an individual account session.

Record maintained as part of Celeris Route's ordinary platform identity-verification and account-security operations. This document is a fictional sample-case record for the DecisionLayer arbitration simulator.
