CELERIS ROUTE

ACCOUNT ACCESS & AUTHENTICATION RECORD

Record type: Account security / authentication requirement

Driver account: CR-DRV-48217

Account holder: Daniel Reyes

Record purpose: Describe the authentication requirement applicable to identity-verification functions.

ACCOUNT ACCESS REQUIREMENT

Certain functions within the Celeris Route driver platform, including facial identity verification, are available only after the driver account has successfully completed the required account authentication step.

For an identity-verification session, the account access sequence is: (1) the account session successfully completes authentication; (2) the identity-verification function becomes available; and (3) the facial image is captured and submitted for comparison with the identity image associated with the account.

AUTHENTICATION RECORD

Account	CR-DRV-48217
Authentication status	Successful authentication required before facial verification
Applicable verification events	June 14, June 21, and July 2, 2026
Account security function	Facial identity verification

WHAT THE RECORD ESTABLISHES

A successful authentication establishes that the account session passed the required account-authentication step before the relevant verification function was used.

The authentication record does not, by itself, establish the identity of the individual who entered or possessed the account password or other authentication credentials. It also does not establish who operated the device during a particular authenticated session.

ACCOUNT SECURITY REQUIREMENT

The driver is responsible for maintaining the confidentiality of account credentials and for taking reasonable steps to protect the account from unauthorized access. A driver must not knowingly provide account credentials to another person or knowingly permit another person to use those credentials to access the account.

SYSTEM NOTE

This record describes the ordinary authentication and identity-verification workflow used by the Celeris Route platform. It is not a determination that the account holder personally entered credentials for any particular session and does not determine whether any access was authorized by the account holder.

Record generated from Celeris Route account-security procedures maintained during ordinary platform operations. Synthetic fictional account data used solely for the DecisionLayer sample arbitration case.
